PROJECT PORTFOLIO

A planner who turns customer and market insight into results

Service Planning Portfolio

Minkyeong Kim

※ All data shown in this portfolio are example figures.

CONTENTS

Contents

01 **Enterprise AI Infrastructure** — AI agent platform (the in-house AI agent) / MD business ontology / PaaS operations

02 **AI Talent Management** — AI agent training / Fashion AI platform

03 **Internal Business Systems Planning** — Image Platform / RAG search

04 **Strategy Projects (Internal Consulting)** — Naver channel strategy / Padded-jacket rebranding / China brand churn analysis

SUMMARY

Summary

Started in customer and market analysis for fashion brands; now building the platform that connects company data to AI agents and designing the company-wide AI transformation. From the numbers to the shipped service, end to end.

No.	Part	Project	Period	Key result
01	Enterprise AI Infrastructure	**Knowledge Graph-based Enterprise AI Agent Platform**	2025.11 – ongoing	**160** Agents completed
02	Enterprise AI Infrastructure	**Building the Ontology: Adding a Business-Concept Layer to the Data Catalog**	2026.11 – ongoing	**markdown rate · reorder quantity · reorder timing · allocation · main sales channel** Wider answer scope (judgment questions)
03	Enterprise AI Infrastructure	**PaaS-based Service Operations**	2026.03 – ongoing	**311** Deployments
04	AI Talent Management	**Company-wide AI Agent Training**	2026.02 – ongoing	**500 in total** AI agent training attendees
05	AI Talent Management	**Fashion AI Platform: Web-App Sharing, Recommendation & Submission Portal**	2026.08 – in operation	**160 total** Web apps uploaded
06	Business Systems	**Company-wide Integrated Image Platform**	2025.09 – 2026.03	**6 days → 1 hour** Listing lead time
07	Business Systems	**Internal Strategy-Document RAG Search**	2025.01 – 2025.07	**98%** Budget saved
08	Strategy Projects	**Redefining the Naver Channel Sales Strategy**	2024.01 – 2024.02	**137%** Live-commerce conversion growth
09	Strategy Projects	**the sports brand Padding Rebranding Strategy**	2024.11 – 2024.12	**100%** Sales growth among customers under 30
10	Strategy Projects	**Customer Churn Analysis for a Premium Brand in China**	2025.02 – 2025.04	**+8%** Sales growth vs. same month last year

Part 01 | Enterprise AI Infrastructure

Knowledge Graph-based Enterprise AI Agent Platform

A knowledge-graph-based enterprise AI agent platform where a plain-language request is enough to build a web app connected straight to the company DW

Vibe-coding demo: one word, 'connect it', links it to live Snowflake data

Period

2025.11 – ongoing

Purpose

1. Build web apps connected to the company DW with plain-language requests alone
2. Query BI data in plain language

Role & contribution

- Built a mapping dictionary between business terms (brand, season, store) and DW tables and columns: organized synonyms and reference values so the same question gets the same answer
- Defined requirements for the MCP server linking the graph and the DW: agreed the tool list, input/output formats and read-only permission scope with developers
- Designed the plugin rollout process: wrote the install guide, connector setup steps and a troubleshooting guide for common errors

Results

Agents completed	Work hours saved by agents	Time to query in-house (BI) data
160	**8,180 h / month**	**85% less**
as of Sept 2026 (first month after launch)	as of Sept 2026 (first month after launch)	AS-IS 27 min → TO-BE 4 min

Knowledge Graph-based Enterprise AI Agent Platform

A knowledge-graph-based enterprise AI agent platform where a plain-language request is enough to build a web app connected straight to the company DW

kpi-query skill: natural-language question → metric definition resolved from the knowledge graph → DW query → answer with sources

Background

1. Web apps built by employees could not connect to the company DW, so they saved little real time; the aim was to connect individually built web apps to in-house data while keeping security issues to a minimum.
2. Querying in-house BI data took 27 minutes on average; the aim was to cut that time by 75% with AI.

How it went

01 Knowledge graph design and build › **02** MCP servers connecting the graph and the DW › **03** Skills and hooks › **04** Plugin rollout and offline training › **05** Weekly use-case broadcasts across affiliates

Key points

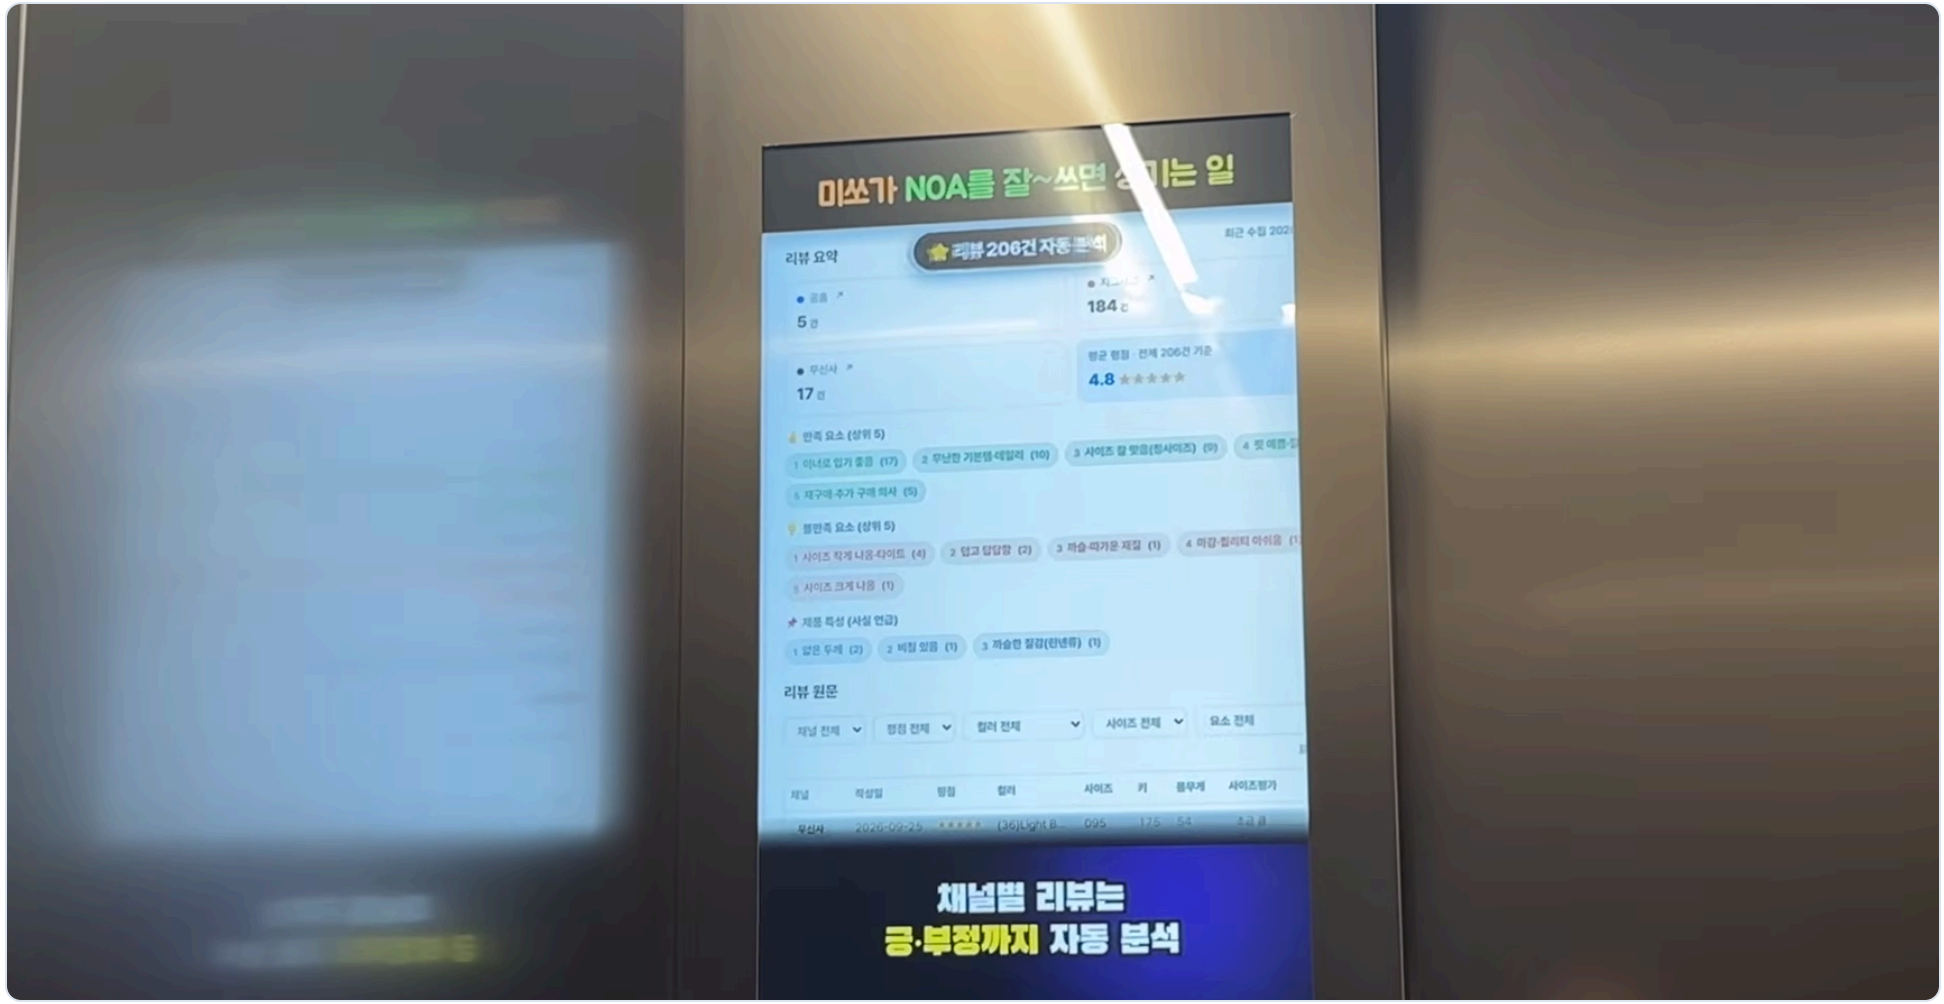

01 **Question** Ask in everyday words, e.g. “What were Brand A Gangnam's sales this May?”

02 **Knowledge graph lookup** One graph lookup returns the metric definition and joins; SQL is written only from them

03 **Answer with sources** Read-only DW query with the user's own permissions; definition, scope and sources attached

Knowledge Graph-based Enterprise AI Agent Platform

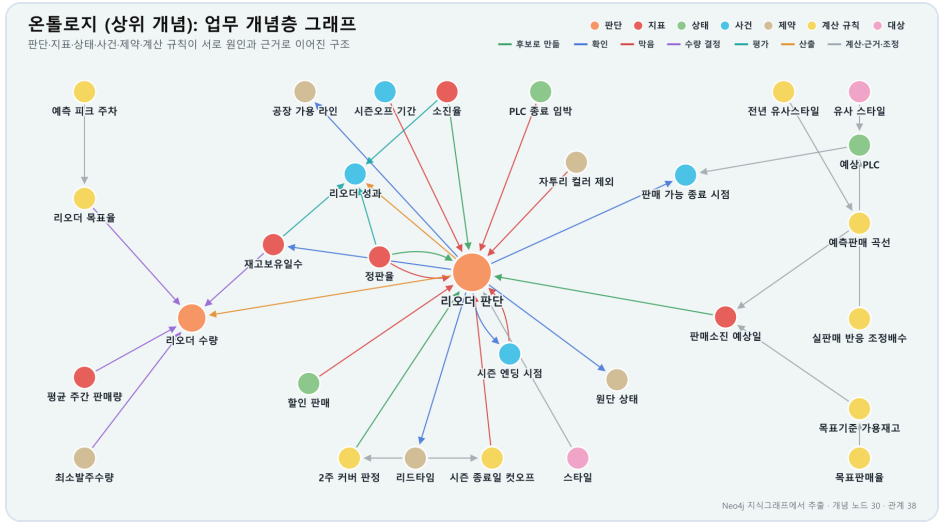

Key screens

Step 5 in practice: a weekly use-case video broadcast on office elevator screens (automatic positive/negative review analysis by channel)

Building the Ontology: Adding a Business-Concept Layer to the Data Catalog

From a semantic layer centered on DW tables and columns to a business ontology with business-judgment concepts added

Ontology (upper concepts): the business-concept layer where decisions, metrics, states, events, restrictions and calculation rules are linked as causes and grounds (30 nodes · 38 relations)

Period

2026.11 – ongoing

Purpose

Extends the range of answers to judgment questions by building an ontology that holds business know-how on top of the existing data catalog (semantic layer)

Role & contribution

- Organized business concepts and causal relations through interviews with practitioners
- Defined the concept-table and relation-table formats (direction, attributes, exceptions)

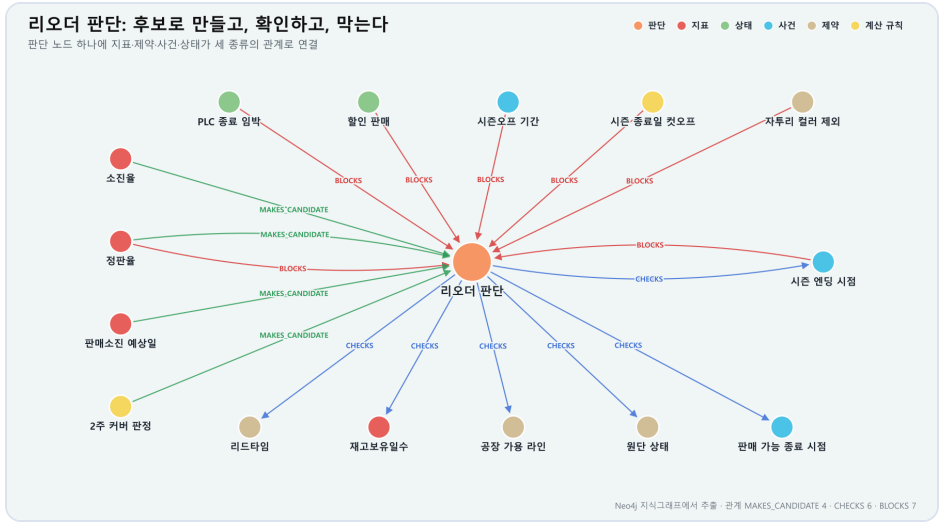

Results

Wider answer scope (judgment questions)

markdown rate · reorder quantity · reorder timing · allocation · main sales channel

Building the Ontology: Adding a Business-Concept Layer to the Data Catalog

From a semantic layer centered on DW tables and columns to a business ontology with business-judgment concepts added

Reorder decision: metrics, restrictions, events and states make it a candidate (MAKES_CANDIDATE), are checked (CHECKS) and block it (BLOCKS)

Background

The company's unwritten rules and ways of working were not in it, so even with a semantic layer, users had to enter the company's judgment criteria again in every session.

How it went

01 Interview SO/MD staff (judgment criteria in the work) › **02** Write concept and relation tables › **03** Migrate to Neo4j › **04** Connect the Neo4j MCP

Key points

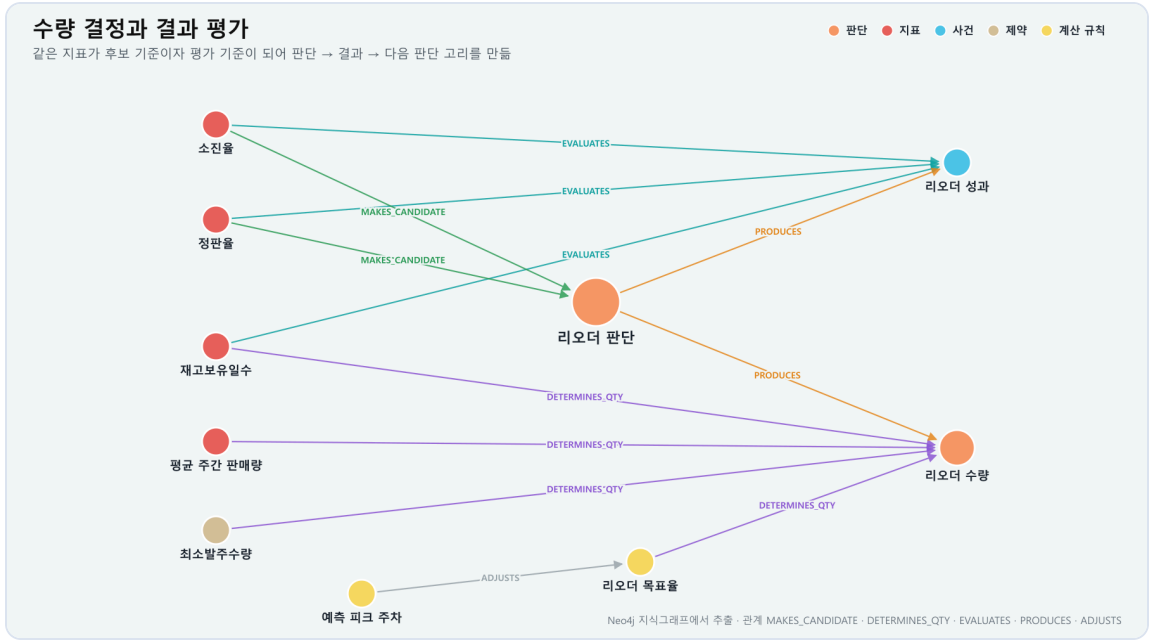

01 **User judgment query** “Why isn't this style selling? What should we do?”

02 **Find the decision node** Check which PLC stage it is in, such as introduction or decline.

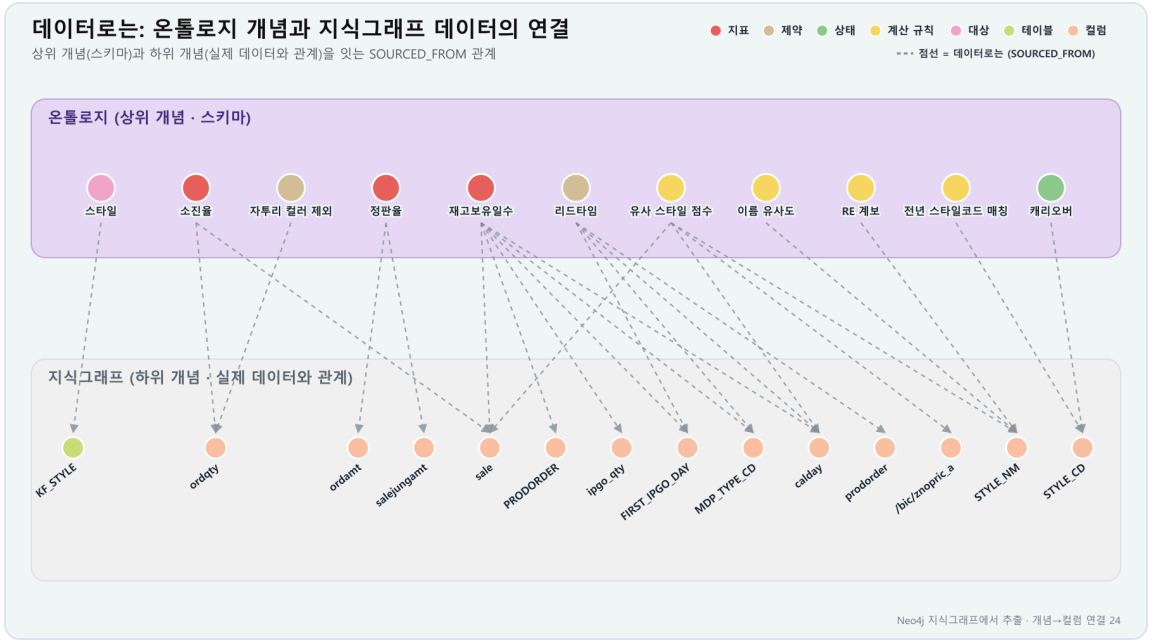

03 **Seen in data as** Confirm exact numbers through the lower-level knowledge graph: full-price sell-through from sales metrics, fit complaints from review-text tables.

Building the Ontology: Adding a Business-Concept Layer to the Data Catalog

Key screens

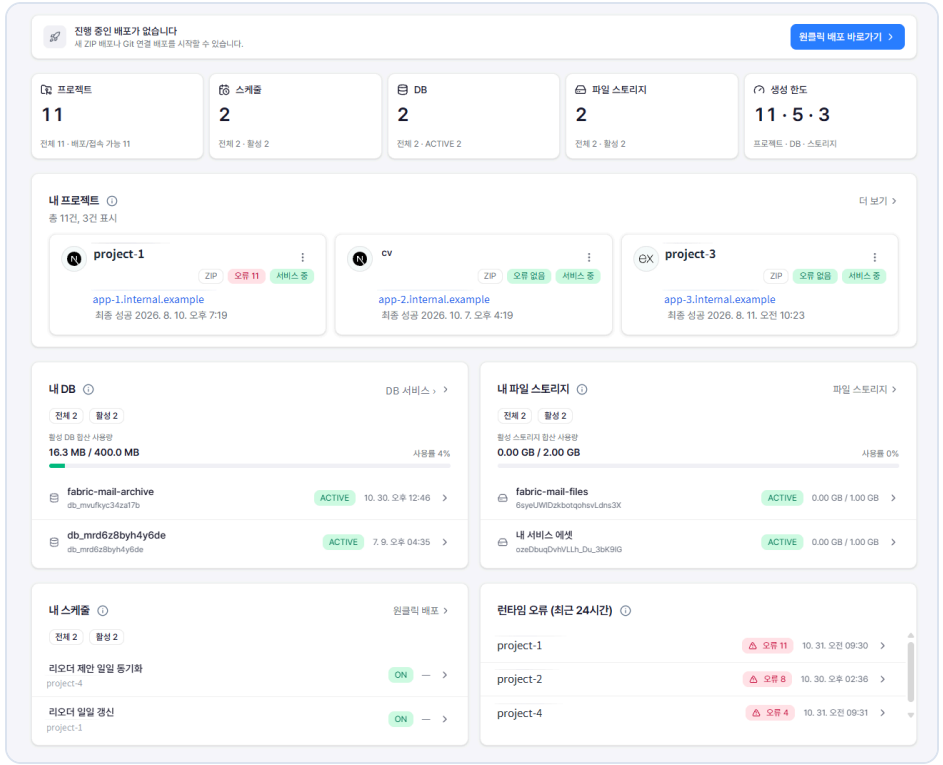

Quantity and evaluation: the same metrics serve as candidate criteria and evaluation criteria, forming a decision → result → next decision loop

Seen in data as: SOURCED_FROM relations tie upper concepts (ontology) to lower concepts (knowledge graph) (24 links)

PaaS-based Service Operations

An in-house PaaS that deploys the apps non-developers build and provides the DB, file storage and schedules they need

The status of the web apps each person has deployed, as seen on their own dashboard

Period

2026.03 – ongoing

Purpose

An in-house PaaS where line staff deploy the web tools they build without developer help and get operations support. Overall deployment status, per-app MAU and call counts, and deployment domains are managed in one place.

Role & contribution

- Wrote, distributed and taught the one-click deployment guardrails (rules for AI coding tools)
- Designed Claude Code skills (requirements, triggers, behavior) that check a project against PaaS rules before deployment
- Turned recurring deployment and operations inquiries into skill features

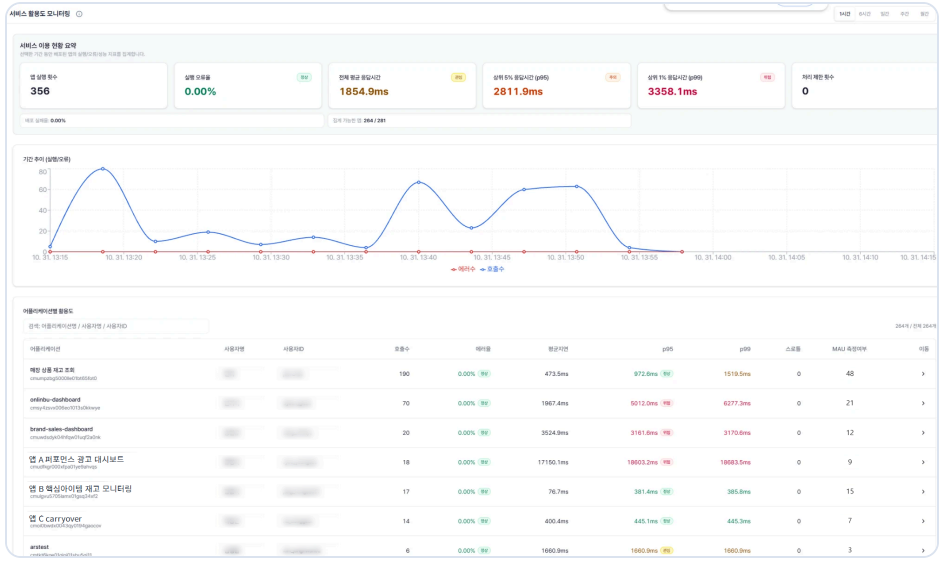

Results

Deployments
311

Deployment success rate
90%
n=235 deployments

PaaS-based Service Operations

An in-house PaaS that deploys the apps non-developers build and provides the DB, file storage and schedules they need

Admin view of every deployed web app

Background

Web services built by individual employees were deployed to individual servers, which made company information hard to manage and made it hard to see which company data left through external DBs and external hosting.
The in-house PaaS was built to bring deployment inside the company, manage it in one place, and consolidate internal information, security and cost.

Key points

01 **One-click deployment** Upload a ZIP or connect a Git repository and the app deploys. Guardrail rules for AI coding tools were shipped first to raise the success rate.

02 **Operations, security and domains on one screen** Usage of each deployed app (MAU and call counts), data-security checks, deployment domains, schedules, DBs and file storage are all managed from one dashboard.

Company-wide AI Agent Training

Small, step by step, repeatedly: employees build AI agents hands-on

AI agent-building training: one-click deployment guide session

Period

2026.02 – ongoing

Purpose

Designed training, onboarding and operational support to reach a 20% AX conversion rate across the organization.

Role & contribution

- Designed the curriculum and job-specific hands-on exercises
- Built the training content: level-based concept training and hands-on sessions (building a web dashboard)

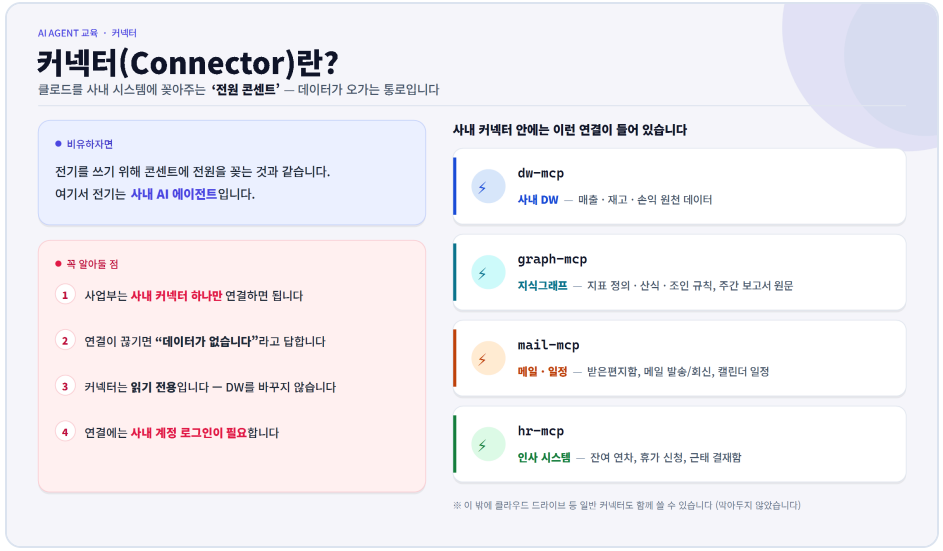

Results

AI agent training attendees
500 in total

Each attendee finishes one web-based tool of their own by the end of every session
1 per session

Company-wide AI Agent Training

Small, step by step, repeatedly: employees build AI agents hands-on

Connector training material

Background

To reach 20% AX adoption in-house, small-group, level-based offline training is repeated for employees who do not know where to start.

How it went

01 Hands-on agent training › **02** Build & deploy support

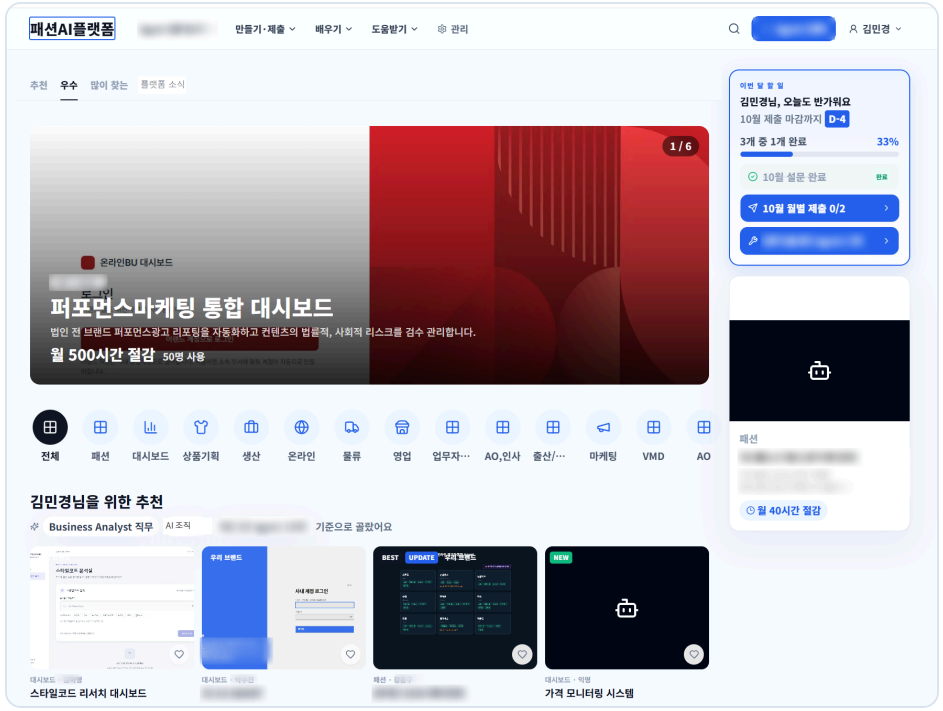

Key points

01 **Level-based concept training** Because skill levels differ widely, one lecture is too hard for beginners and dull for experienced staff, so classes are split by level and kept small. Concept training is the preparation for the hands-on session that follows.

02 **Hands-on sessions** Right after concept training, even first-time attendees turn a problem from their own work into one agent and publish it. Completion means one web-based tool of their own by the end of every session.

Fashion AI Platform: Web-App Sharing, Recommendation & Submission Portal

Where employees publish business web apps built with the in-house AI platform, get similar apps recommended by job, and submit results

Fashion AI Platform home: best web-app banner · categories · monthly to-do sidebar

Period

2026.08 – in operation

Purpose

Employees upload the business web apps they built with the in-house AI platform and browse apps from the same job, and check their own AI capability level

Role & contribution

- Service planning and information architecture
- User flow design: UI/UX and menus such as issuing a PAT, so people use the site without friction
- Monthly submission flow design

Results

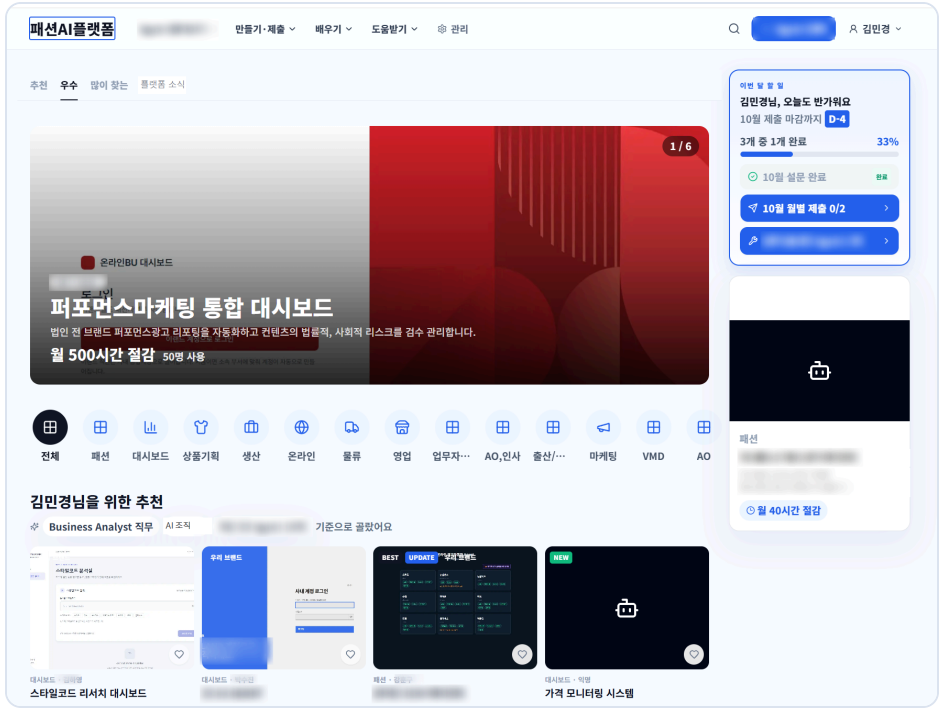

Web apps uploaded

160 total

since 2026.09

Fashion AI Platform: Web-App Sharing, Recommendation & Submission Portal

Where employees publish business web apps built with the in-house AI platform, get similar apps recommended by job, and submit results

Fashion AI Platform home: best web-app banner · categories · monthly to-do sidebar

Background

Business web apps built with the in-house AI platform multiplied, but who built what and what it achieved was scattered.
Register the web app → submit monthly results → evaluate → train now runs as one flow that records AX status automatically.

Key points

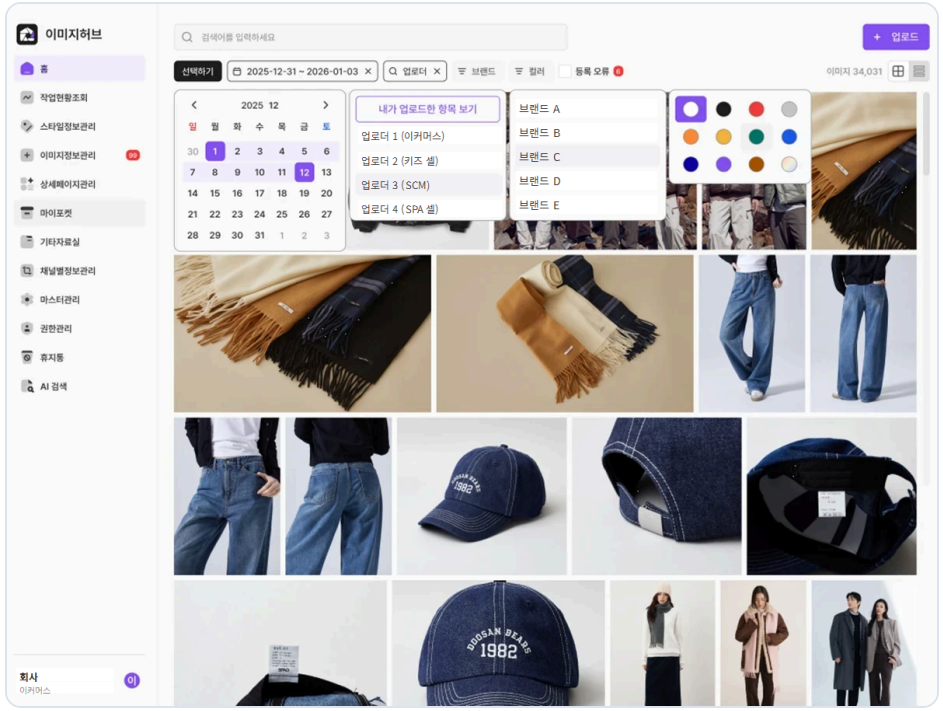

01 **Home: tasks and recommended reference agents the moment you arrive** The first screen shows this month's tasks together with web apps built by colleagues in the same job that fit me

02 **Web-app registration and monthly submission** A form that states what changed in numbers, plus monthly results; the source data for evaluation and the talent pool

03 **Requests and inquiries that accumulate automatically** Missing data or stuck on usage? Request or ask in the platform; recurring questions become FAQ

Company-wide Integrated Image Platform

Unified management of every image in the company, with a flow built from image registration to delivery to online channels

Integrated image platform home: upload date, uploader, brand and color filters plus a ‘registration error’ badge locate any of tens of thousands of images in the grid

Period

2025.09 – 2026.03

Purpose

Manage every product image in the company (model shots, flat-lay shots, thumbnails) in one company-wide integrated image platform, and let AI adapt registered images and product data to each channel's specs and send them straight to online channels. The goal is to end re-entering the same information channel by channel.

Role & contribution

- Defined what the integrated image platform manages: product code, name, material, color, size, price, inventory and images (model, flat-lay, thumbnail) as the single source of product truth
- Mapped where data is created and how it flows across SAP, BI, local storage, Google Drive and email
- Designed the generative-AI workflow: per-item keyword extraction, channel-specific names and promotional copy, image spec adaptation
- Turned interviews with MD, photo and ops teams into requirements for listing procedures and per-channel rules

Results

Listing lead time

6 days → 1 hour

from receiving to on sale

Standard listings automated

100%

only events and promotions remain: 80% of time saved

Company-wide Integrated Image Platform

Unified management of every image in the company, with a flow built from image registration to delivery to online channels

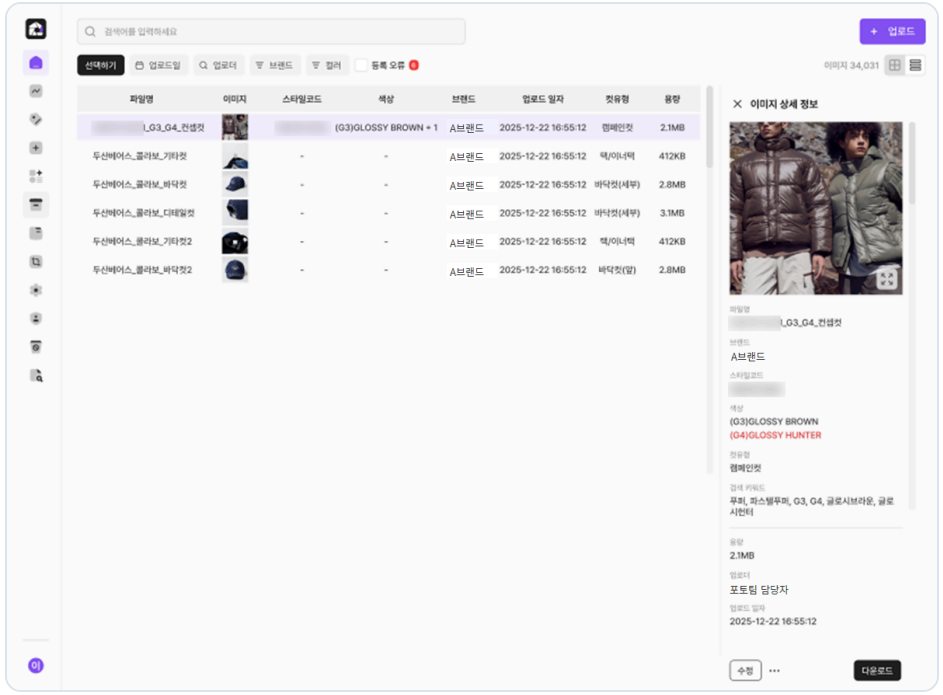

Image registration review and detail check

Background

Interviewing MD and AMD staff for three weeks and surveying their work showed that 54% of simple, repetitive work was ‘product listing and management’ (1,865 hours per month). The core bugs were ① product data scattered across SAP, BI, local folders, drives and email, and ② manual adjustment to each channel's different specs.

How it went

01 3-week MD/AMD work census › **02** Define the two core bugs › **03** Image platform attributes and data flow › **04** AI detail pages and channel-optimization agent › **05** the listing hub → all channels automatically

Key points

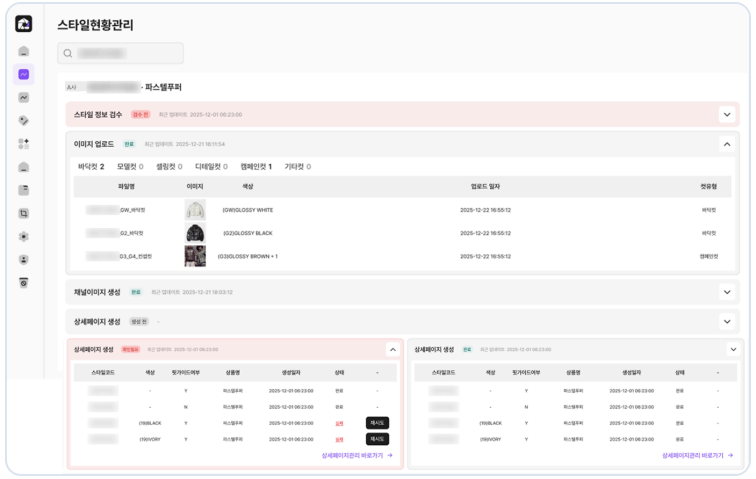

01 **[AS-IS] The previous business process — seven core bugs** Five teams passed the same information along, re-typing it each time.

02 **[TO-BE] After the system — one image platform flow** Re-typing steps disappear; the listing team only reviews and handles exceptions.

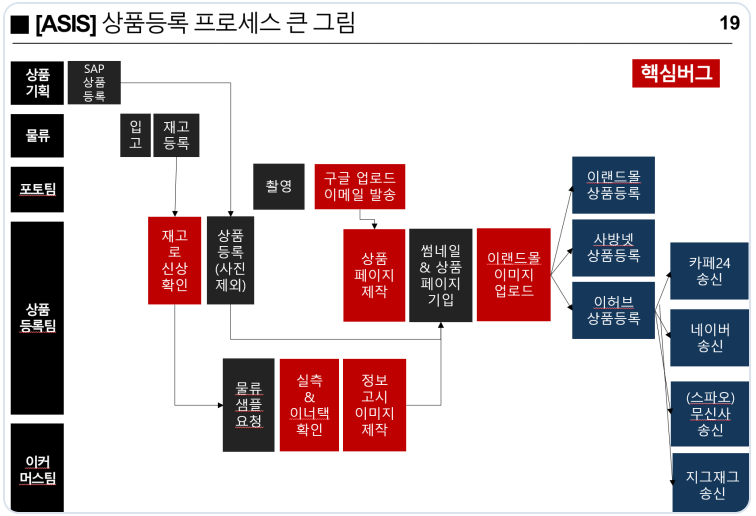

03 **Change ① Lead time from 6 days to 1 hour** Listing lead time from receiving to on sale: average 6 days → at most 1 hour.

Company-wide Integrated Image Platform

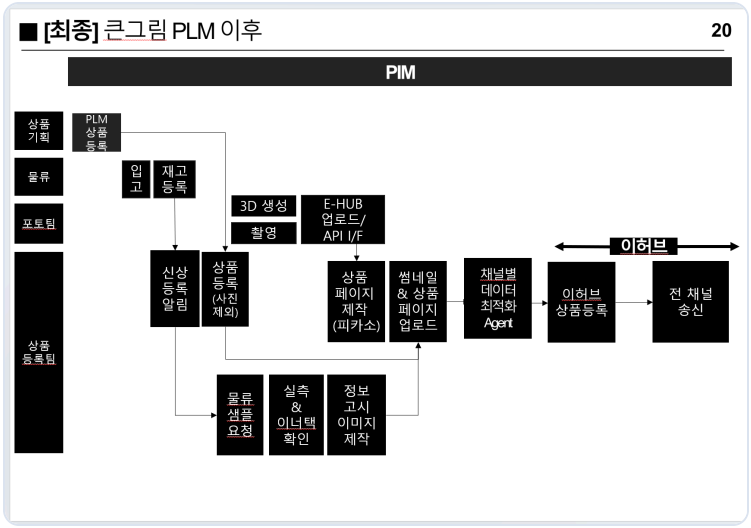

Key screens

Style status: image upload → automatic per-channel image editing → review of the detail-page generation stage

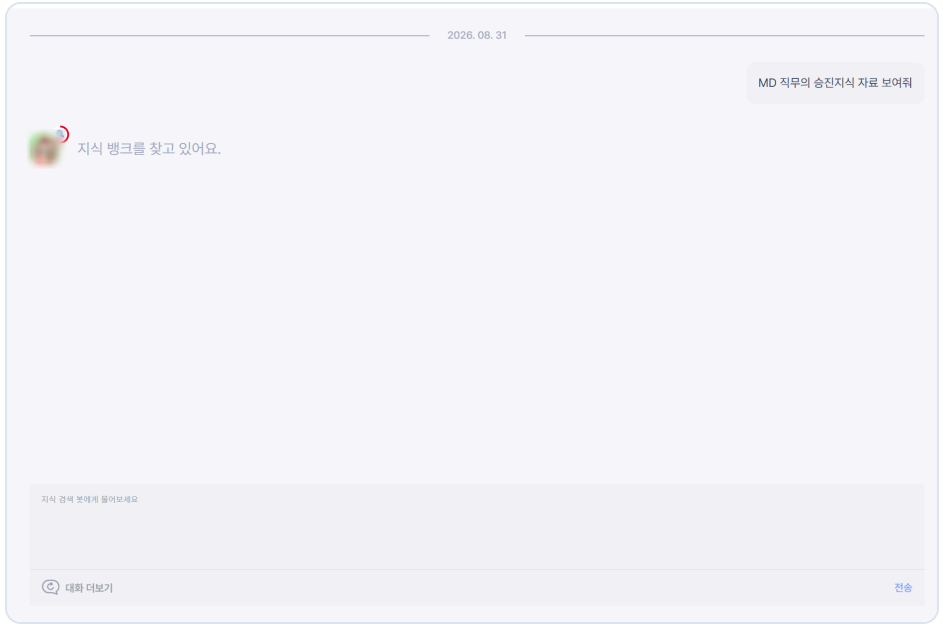

[AS-IS] The old listing process: the same information re-typed by people across five teams. The seven red boxes are the core bugs

[TO-BE] The the image platform flow after PLM: new-product alerts go out automatically, shots and 3D renders enter through the hub, AI builds the pages, a per-channel agent fits each format and the listing hub sends to every channel. Every red box (core bug) is gone

Internal Strategy-Document RAG Search

Not simple search, but a service that searches the organization's decision criteria

Finding strategy documents in plain language

Period

2025.01 – 2025.07

Purpose

Turned sales data, product information and internal project documents into an AI search and summary service.

Role & contribution

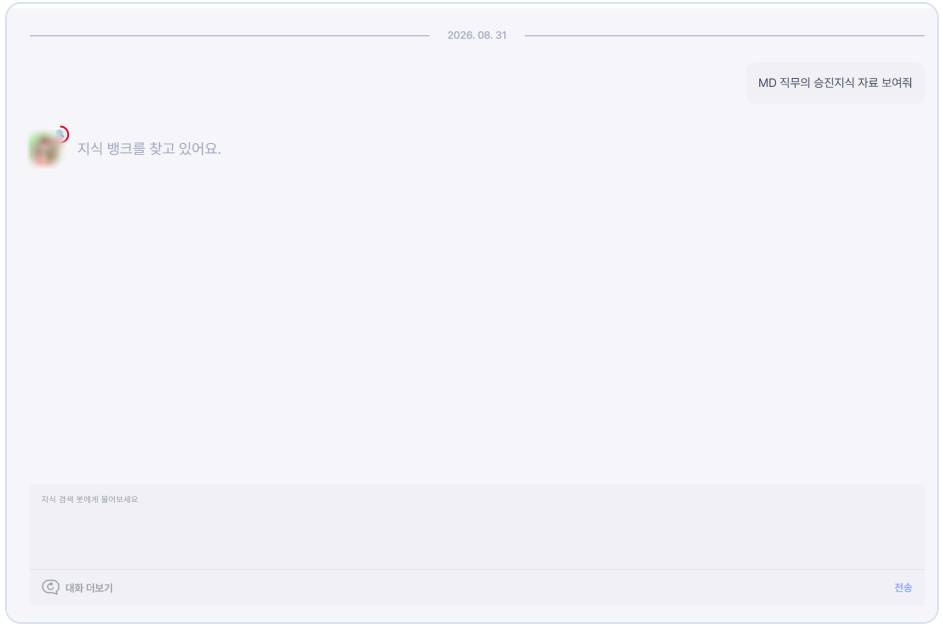

- Converted strategy documents into JSON
- Planned the UI/UX of the search screen
- Iterated on preprocessing and retrieval logic through repeated user tests

Results

Budget saved	Search accuracy	Satisfaction	Usage in core teams
98%	**90%+**	**4.9 / 5**	**7× / week**
Self-built vector DB vs. allocated budget		N=68	N=68

Internal Strategy-Document RAG Search

Not simple search, but a service that searches the organization's decision criteria

Finding strategy documents in plain language

Background

An asset without a way to use it: fifteen years of high-quality strategy material had accumulated, but image-heavy PPTs and file-level storage made it hard to search and use.

How it went

01 Unstructured knowledge › **02** OCR / image-to-text › **03** Vector DB › **04** GPT API natural-language search › **05** Iterative user testing

Key points

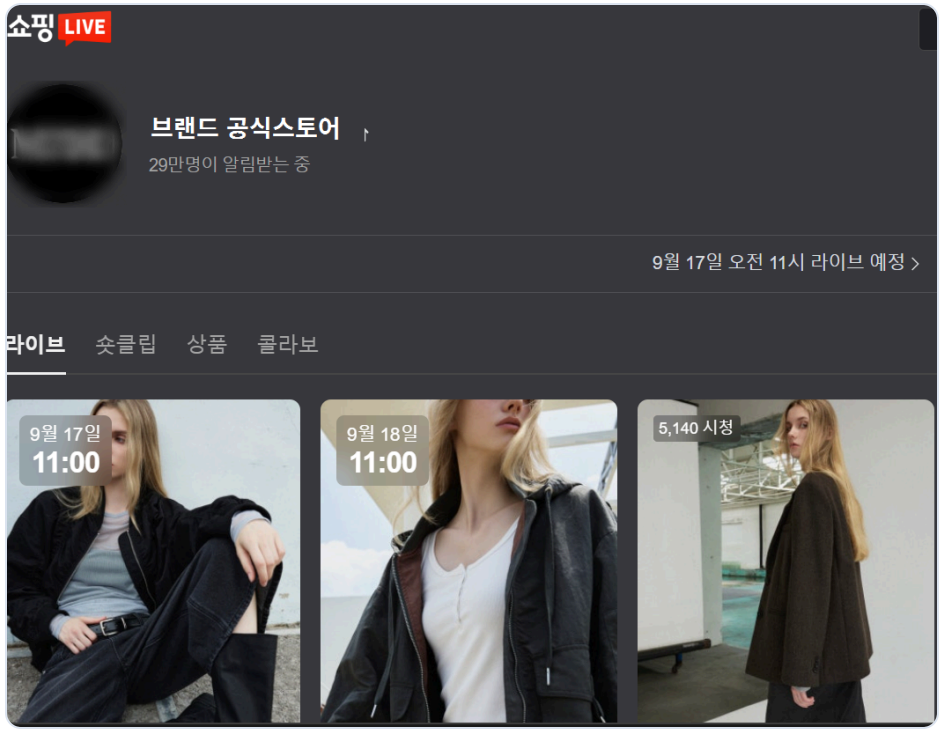

01 **Question** Ask in plain language.

02 **Question embedding** Vectorized with the same model as the documents.

03 **Similar-document search** Closest chunks retrieved from the vector DB.

Redefining the Naver Channel Sales Strategy

Why it was customer-structure redesign, not channel expansion

Naver Shopping Live channel

Period

2024.01 – 2024.02

Purpose

Redesigned product, content and channel messaging from an analysis of each customer group's entry motives, lifting channel sales.

Role & contribution

- Reinterpreted the limits of platform-led growth as a customer-structure problem
- Analyzed purchase criteria and entry motives of customers in their 40s
- Redesigned content messaging, review strategy and pricing around customers' purchase criteria

Results

Live-commerce conversion growth

137%

YoY, 0.8% → 1.9%

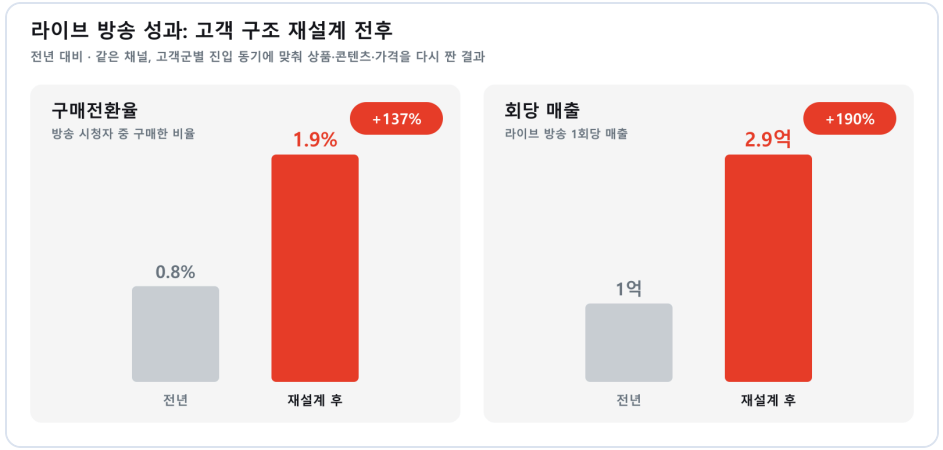

Live-commerce sales per show

190%

YoY, ₩100M → ₩290M

Redefining the Naver Channel Sales Strategy

Why it was customer-structure redesign, not channel expansion

Live commerce results: conversion 0.8% → 1.9%, sales per show 100M → 290M won (year on year)

Background

Growing online sales called for expanding into new online channels with a strategy to match. Online sales had been concentrated among customers aged 20–35, so a strategy to broaden both online channels and online customers was needed.

Key points

01 Growing online sales called for a strategy to expand the brand into a new online channel.

02 Analyzed why online customers in their 40s buy; redesigned products, content and pricing.

03 Live conversion rose from 0.8% to 1.9%; sales per show from ₩100M to ₩290M.

the sports brand Padding Rebranding Strategy

Designing core products from big data

Market analysis: shrinking padding demand, growing off-season padding demand

Period

2024.11 – 2024.12

Purpose

Redefined product strategy and marketing messages from sales, review and platform data by age group.

Role & contribution

- Analyzed men's and women's needs for padding items
- Analyzed three years of our own padding sales by item
- Analyzed reviews of top-selling items on the three key platforms

Results

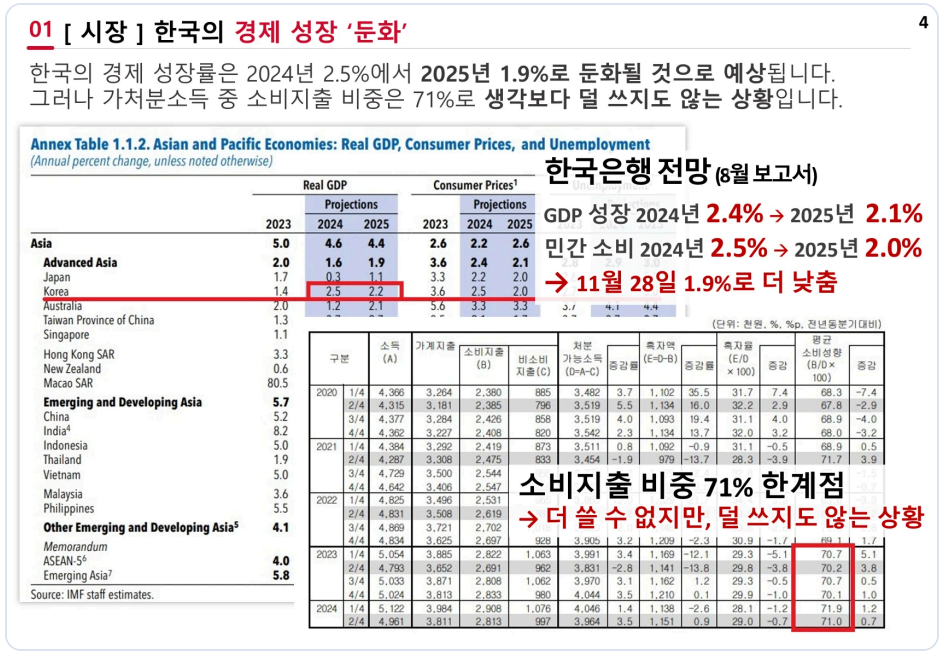

Sales growth among customers under 30

100%

25FW vs. 24FW

the sports brand Padding Rebranding Strategy

Designing core products from big data

[Market] Slowing growth: 1.9% forecast for 2025, consumer spending at a 71% ceiling of disposable income

Background

Customers wanted better value for the same money, and padded jackets were shifting from natural to synthetic fill.
Our planning carried over last year's top styles, missing customers under 30 and men in their 30s.

How it went

01 Market: economy and spending › **02** Market: fill materials of top-ranked jackets › **03** Benchmark: competitor product trends › **04** Benchmark: age and gender preference › **05** Redefine core products and message

Key points

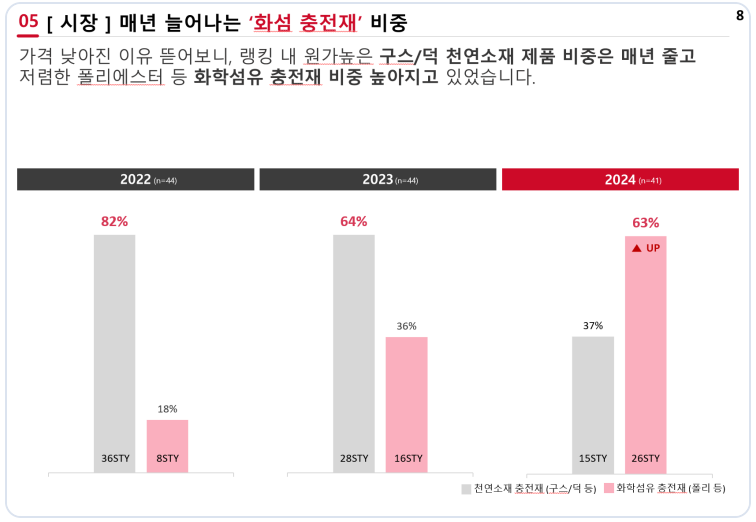

01 **[Market] Growth slows, spending at its ceiling** 1.9% growth forecast for 2025, spending at 71% of income. Not closing wallets, but choosing better value for the same money.

02 **[Market] Synthetic fill rising every year** In top-ranked jackets, natural fill fell 82% → 37% and synthetic rose 18% → 63% (2022 → 2024). That is why prices fell.

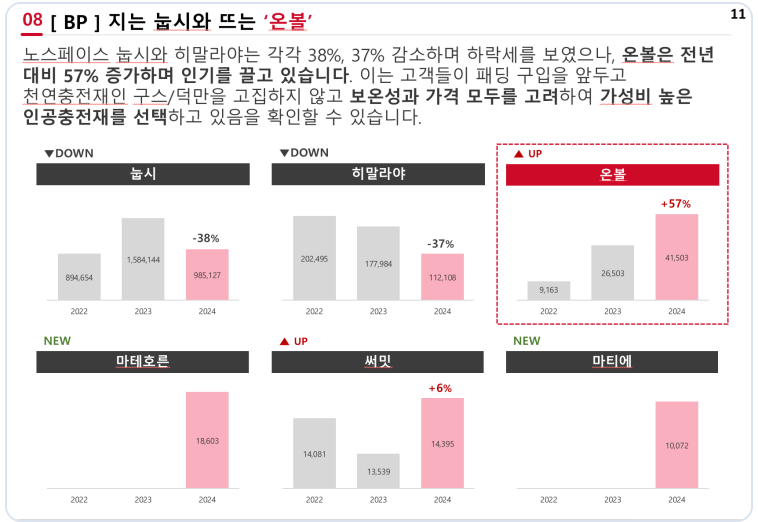

03 **[Benchmark] Falling Nuptse, rising Onball** The North Face Nuptse -38%, Himalayan -37%, synthetic-fill Onball +57%. A value choice weighing warmth and price.

the sports brand Padding Rebranding Strategy

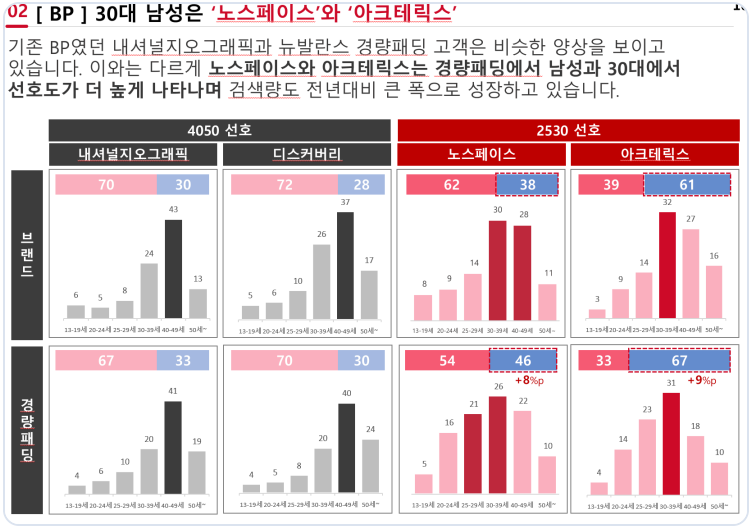

Key screens

[Market] Synthetic fill rising every year: natural (goose/duck) 82% → 64% → 37%, synthetic 18% → 36% → 63%

[Benchmark] Falling Nuptse, rising Onball: down jackets decline while the synthetic-fill Onball grows 57%, a value choice weighing warmth and price together

[Benchmark] Men in their 30s choose The North Face and Arc'teryx: the old benchmarks skew to 40s and women, the new ones to 25–39 and men

Customer Churn Analysis for a Premium Brand in China

Six non-customer studies to find ‘brand casual’, localized for white-collar (白领) women

Store in China

Period

2025.02 – 2025.04

Purpose

Cross-checked non-customer interviews, street-style surveys, review big data and social media to find why sales fell and whom to win, carried through to SS and FW product input.

Role & contribution

- Defined the cause of declining sales as a shift in customers' workwear norms, not the products
- Ran six customer-research methods from zero, revising questions and methods each round, and wrote them up as the product customer-research validation process
- Derived steady and trend types per item and customers' top needs and complaints from three years of Tmall top-20 sales data and review big data
- Documented basics and differentiators for dresses, denim, knits/cardigans, shirts, tees and jackets by learning from benchmarks (Ralph Lauren, Edition, MO&Co., Uniqlo)
- Decided SS and FW inputs (type, fit, color, fabric) with the local merchandising team

Results

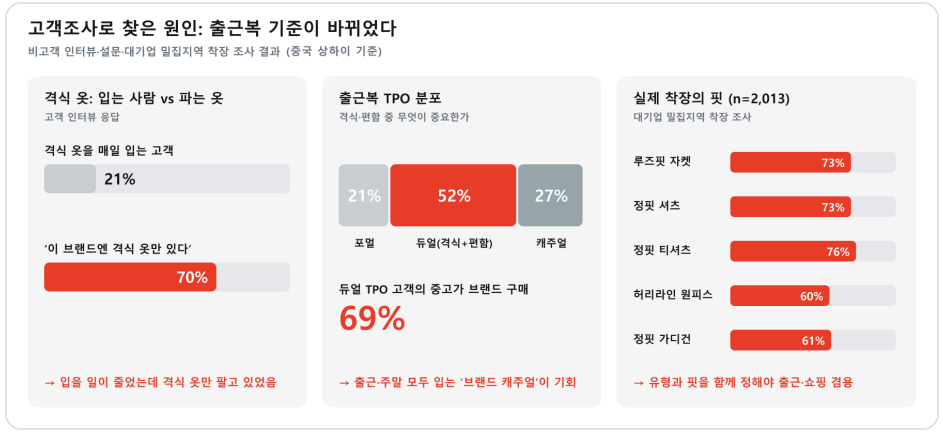

Sales growth vs. same month last year

+8%

from decline to growth

Customer Churn Analysis for a Premium Brand in China

Six non-customer studies to find ‘brand casual’, localized for white-collar (白领) women

Key research numbers: formal demand 21% vs 70% supply perception, dual TPO 52%, actual outfit fits

Background

The brand kept decade-old hits such as glossy colored blouses, and sales fell 27% a year.
Office dress had gone casual, but only formal suiting remained: clothes ‘worn one day a week’.

How it went

01 Six non-customer studies › **02** Diagnosis: once-a-week wear · customer mismatch › **03** PART ① brand casual principles › **04** PART ② Localizing to white-collar needs › **05** Basics and differentiators per item › **06** SS · FW product input

Key points

01 **[Research] Six customer studies + three-year trends** Cross-checked interviews, shop-alongs, surveys, dry-cleaner counts, outfits and review big data. Three-year sales trends, not last season's bestsellers.

02 **[Diagnosis ①] Wearable one day a week, so a waste of money** Office dress went casual; the brand stayed formal. 21% wore formal clothes daily, 70% said it had only formal clothes.

03 **[Diagnosis ②] The customer to win: global-minded white-collar women** Women aged 35–45 at large companies, 44% global-brand buyers. The brand's gold trims and loud colors read as ‘old’.
